## Instructions

As indicated, either fill in blank space with appropriate symbol or number or circle the correct answer(s). Some multiple choice questions may have more than one correct answer, in which case all correct answers are required for full credit.

Use back of pages for your scratch work.
Physical constants you may need:
$\mathrm{N}_{0}($ Avogadro's $\#)=6.022 \times 10^{23} \mathrm{~mol}^{-1}$
1 angstrom $(\AA)=10^{-10} \mathrm{~m}=100 \mathrm{pm}$
Speed of light $=3.0 \times 10^{8} \mathrm{~m} / \mathrm{s}$
H (Planck's constant) $=6.626 \times 10^{-34} \mathrm{~J} \cdot \mathrm{sec}$
Ionization Potential of $\mathrm{H}=2.18 \times 10^{-18} \mathrm{~J}$
$0 \mathrm{~K}=-273.15^{\circ} \mathrm{C}$

10 pts 1. For an experiment in lab, a student reacts baking soda $\left(\mathrm{NaHCO}_{3}\right)$ with 6.00 M vinegar $\left(\mathrm{CH}_{3} \mathrm{COOH}\right)$ to produce carbon dioxide $\left(\mathrm{CO}_{2}\right)$ plus sodium acetate $\left(\mathrm{NaCH}_{3} \mathrm{COO}\right)$ and water $\left(\mathrm{H}_{2} \mathrm{O}\right)$. If 0.9864 g of $\mathrm{NaHCO}_{3}$ is reacted with 1.50 mL of vinegar, how many moles of $\mathrm{CO}_{2}$ will be produced?
A) $1.17 \times 10^{-2}$
B) $9.00 \times 10^{-3}$
C) 0.396
D) 6.00
E) 9.00

2. (a) An expected empirical formula for a compound of Mg and O is
A) $\mathrm{Mg}_{2} \mathrm{O}$
B) MgO
C) $\mathrm{MgO}_{2}$
D) $\mathrm{Mg}_{2} \mathrm{O}_{3}$
(b) Similarly, a compound of Li and H
A) is LiH
B) is $\mathrm{LiH}_{2}$
C) doesn't exist
D) is $\mathrm{Li}_{2} \mathrm{H}$
(c) Which of the following is NOT expected to be a stable compound
A) FeO
B) $\mathrm{Fe}_{2} \mathrm{O}_{3}$
C) NaOH
D) $\mathrm{Ca}(\mathrm{OH})_{3}$
A) $10^{-8} \mathrm{~cm}$
B) $10^{-8} \mathrm{~km}$
C) $10^{-8} \mathrm{~m}$
D) 1000 nm
5. Which of the following equations represents the reaction which occurs least vigorously?
A. $\quad \mathrm{Be}(\mathrm{s})+2 \mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Be}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
B. $\mathrm{Ca}(\mathrm{s})+2 \mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
C. $\quad \mathrm{Ba}(\mathrm{s})+2 \mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$

10 pts

6 pts
6. A 0.5 g sample of an unknown acid is neutralized with 20 ml of .25 M NaOH (aq). Assuming the acid has two acidic protons per molecule, the molecular mass of the acid is
A) $25 \mathrm{~g} / \mathrm{mol}$
B) $50 \mathrm{~g} / \mathrm{mol}$
C) $75 \mathrm{~g} / \mathrm{mol}$
D) $100 \mathrm{~g} / \mathrm{mol}$
E) $200 \mathrm{~g} / \mathrm{mol}$
7. Small quantities of chlorine gas can be prepared by the following reaction

$$
a \mathrm{MnO}_{2}(\mathrm{~s})+b \mathrm{HCl}(\mathrm{aq}) \rightarrow c \mathrm{MnCl}_{2}(\mathrm{aq})+d \mathrm{Cl}_{2}(\mathrm{~g})+e \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

where $a, b, c, d, e$ are the stoichiometric coefficients. The ratio $\mathrm{a} / \mathrm{b}$ for the balanced reaction is
A) $1 / 2$
B) $1 / 3$
C) $1 / 4$
D) $2 / 3$
8. The volume of 1 mole of solid Ne is: $\mathrm{V}=13.2 \mathrm{~cm}^{3}$
(a) Estimate the radius of a Ne atom, $\mathrm{r}_{\mathrm{Ne}}$
if the volume of a mole of atoms is $13.2 \mathrm{~cm}^{3}$, then we can just solve for the volume of 1 atom $V_{\text {atom }}=\frac{13.2 \mathrm{~cm}^{3}}{6.02 \times 10^{23}}=2.19 \times 10^{-23} \mathrm{~cm}$
the cube root will be the diameter of one atom in $\mathbf{c m}$
diameter $_{\text {atom }}=\sqrt[3]{2.19 \times 10^{-23}}=2.8 \times 10^{-8} \mathrm{~cm}$
the diameter is $2 *$ radius, so the radius is $1.4 \times 10^{-8} \mathrm{~cm}$ or $1.4 \AA$

[Show work and put estimate in box]

4 pts
(b) The distance between the centers of nearest neighbor oxygen atoms in ice is:
A. roughly the same as $\mathrm{r}_{\mathrm{Ne}}$
B. roughly the same as $2 \mathrm{r}_{\mathrm{Ne}}$
C. smaller than $\mathrm{r}_{\mathrm{Ne}}$

4 pts
(c) The space filling radius of the $\mathrm{F}^{-}$ion is:
A. roughly the same as $\mathbf{r}_{\mathrm{Ne}} \quad$ B. about $1 \AA$ larger than $\mathbf{r}_{\mathrm{Ne}}$
C. about $1 \AA$ smaller than $\mathrm{r}_{\mathrm{Ne}}$
(d) The F-F bond length of the $\mathrm{F}_{2}$ molecule is:
A. roughly the same as $2 \mathbf{r}_{\mathrm{Ne}}$
B. about $1 \AA$ larger than $2 \mathrm{r}_{\mathrm{Ne}}$
C. about $1 \AA$ smaller than $2 \mathrm{r}_{\mathrm{Ne}}$
(e) The closest distance between F atoms of different $\mathrm{F}_{2}$ molecules in solid $\mathrm{F}_{2}$ is:
A. roughly the same as $2 \mathrm{r}_{\mathrm{Ne}}$
B. about $1 \AA$ larger than $2 \mathbf{r}_{\mathrm{Ne}}$
C. about $1 \AA$ smaller than $2 \mathrm{r}_{\mathrm{Ne}}$
9. (a) According to the uncertainty principle, determining the location of a particle to some high accuracy:
A. is made possible by lowering the energy of the particle so as not to disturb it
B. forces the energy of the particle to be large
C. can never be accomplished
(b) The fact that light diffracts:
A. demonstrates that light is composed of photons with particlelike properties
B. demonstrates that light has wave-like properties
C. implies an uncertainty in the wavelength of a photon

4 pts

8 pts

5 pts
(a) Suppose that you shine light of energy 0.75 $\mathrm{R}_{\mathrm{H}}$ on an H atom in the ground state. What happens to the light and to the electron? ( $\mathrm{R}_{\mathrm{H}}$ is $2.179 \times 10^{-18} \mathrm{~J} / \mathrm{atom}$ )
A) The light is absorbed and the final energy of the electron is $-0.20 \mathrm{R}_{\mathrm{H}}$.
B) The light is absorbed and the final energy of the electron is $-0.25 \mathrm{R}_{\mathrm{H}}$.
C) The light is absorbed and the final energy of the electron is $-0.80 \mathrm{R}_{\mathrm{H}}$.
D) The light is not absorbed and the final energy of the electron is $-1.00 \mathrm{R}_{\mathrm{H}}$.
10. Given the diagram for the electronic energy levels of hydrogen atom, answer the two questions below.

Atomic Energy Levels for Hydrogen
A) $10^{-13} \mathrm{~J}$
B) $10^{-18} \mathrm{~J}$
C) $10^{-23} \mathrm{~J}$
D) $10^{-27} \mathrm{~J}$

5 pts (b) What wavelength of light (nm) will be emitted by an excited hydrogen atom when an electron relaxes from the $n=4$ to the $n=2$ level?
A) 954
B)
656
C) 486
D) 434 E)
410

## Extra Credit: 10 pts

10. An electron bound in an atom is photo ionized with an x-ray of wavelength $\lambda=2.2 \AA=2.2 \times 10^{-10} \mathrm{~m}$. The kinetic energy of the ionized electron is measured to be $1.1 \times 10^{-16} \mathrm{~J}$. With what energy is the electron bound before it is ionized? (Hint: Conservation of energy, the photon energy and the electron's final kinetic energy provide the information you need for your answer)
$K E_{(\text {electron })}=h v-w \quad$ or $\quad K E_{(\text {electron })}=E_{\text {photon }}-$ binding energy or equivalent
convert $E_{\text {photon }}$ to joules $E=h \nu, c=\lambda v, E=h c / \lambda$
$\mathrm{E}_{\text {photon }}=\frac{\left(6.626 \times 10^{-34} \mathrm{Js}\right) \times\left(3.00 \times 10^{8} \mathrm{~m} / \mathrm{s}\right)}{2.2 \times 10^{-10} \mathrm{~m}}=9.0 \times 10^{-16} \mathrm{~J}$
binding energy $=K E_{(\text {electron })}-E_{\text {photon }}$
binding energy $=1.1 \times 10^{-16} J-9.0 \times 10^{-16} J=7.9 \times 10^{-16} J$
[Show your work and put answer in box]
