[8 pts.] b) In this problem you will design a combinational circuit which takes an 8 bit number A[7:0] and calculates $Y=A-1$. For example, if the input $A=00001100_{2}$, then $Y=00001011_{2}$. The circuit is built from 1 bit modules as shown below.

Complete the truth table for the module:

[2 pts.] c) Draw a logic diagram for functions $Y$ and Borrow Out.
[5 pts.] d) Show how the 1-bit modules would be interconnected to create an 8-bit subtract 1 circuit.

Complete the time diagram for the figure below, assuming unit delays for all gates and inverters (transport delay only), and no delay in the wires. (The dashed lines in the diagram represent missing sections of the timing diagram.) Complete the table below with the voltage levels at the specified location in the timing diagram, i.e., $\mathbf{L}$ for low and $\mathbf{H}$ for high. Example: At location 0, the appropriate voltage level is $\mathbf{H}$. (This problem will be graded +1 for correct, 0 for blank, and -1 for incorrect, with minimum score of 0 points.)

[10 pts.] a) Complete the design of the FSM, using minimum number of gates, which implements the specified FSM.

A

[10 pts.] b) Complete the state diagram for the FSM.

Design a Mealey FSM with synchronized input X.H and output Y.H. The output Y should be asserted for one clock cycle whenever the sequence .. 011 or .. 100 has been input on X. Note that patterns may be overlapping, e.g., $X=. .0000111000$.. generates $Y=. .000001001$.. . (The patterns may also overlap themselves.) The machine should start assuming that a " 0 " has already been input.
[12 pts.] a) Complete the state diagram for the sequence detector:
